

## **Fusiderm Gel**

Fusiderm gel is a topical antibiotic for burns. Fusiderm works on the quick healing of burns without polluting the wound. Fusiderm may be used in cases of superficial burns and open abscesses, but also for deep injuries. Due to its colorless and odorless nature, Fusiderm is suitable for treatment of deep injuries in exposed areas (face, neck, arms and places with hair). Fusiderm decreases inflammation of the infected area, and is easily absorbed by the skin. Fusiderm gel moisturizes and softens.

### ***Application***

Apply a thin layer of gel on the infected area 2-3 times daily until improvement. The gel does not need to be massaged into the skin, which is especially beneficial with burn wounds (usually very painful to the touch).

To improve the healing process, it is advisable to follow these guidelines as well:

- Always keep the skin clean
- Bath carefully to avoid a spreading of the infection
- Make sure to wash your hands well before eating or preparing food
- Do not try to press pimples
- Wear thin cotton fabrics rather than synthetic fibers

## Fusiderm cream

Fusiderm cream is the ideal topical antibiotic for treating wounds, boils, acne and other bacterial infections. Fusiderm cream can be used for injuries in humid or wet areas of the body, but also on the face, neck, hands, and folds of the skin. Fusiderm cream prevents transmission or spread of the infection to surrounding areas, ensuring a complete healing in the shortest time possible.

### ***Application***

Apply a thin layer of the cover on the affected area 2 to 3 times a day.

To improve the healing process, it is advisable to follow these guidelines as well:

- Always keep the skin clean
- Bath carefully to avoid a spreading of the infection
- Make sure to wash your hands well before eating or preparing food
- Do not try to press pimples
- Wear thin cotton fabrics rather than synthetic fibers

## Fusiderm Ointment

Fusiderm ointment can be used in dry, crusted, scaly lesions. Fusiderm ointment can be used when it's preferred to cover the lesion with gauze dressing, helping to maintain the skin moisture. Fusiderm ointment is used in cases of superficial infectious injuries (impetigo)
